THE VALUE OF UX

A STARTUP CASE STUDY

VELOCIA

An open loyalty network for urban mobility

From the creators of

Latin American taxi-hailing

The team was focused on what they wanted to build, not on what people would want to use.

Forming our usage hypothesis

- What does this app do?
- Could we convince someone to download it?
- Is the concept interesting enough that they would tell others?

Our Usage Hypothesis

- The idea of selling your transport data for rewards, is interesting enough to tell others about.
- Positioning Velocia, like a traditional loyalty program, will be less controversial, and therefor increase the likely hood of trial.

TEST SCENARIOS

VELOCIA

- Signed on 8 new partners/sponsors throughout our UX phase
- Secured a second round of funding
- Currently getting ready for their first pilot in Miami

MOBILE UX OVERVIEW

WHAT IS UX?

The overall experience of someone using a product and its ability to meet expectations of use.

WHAT IS GOOD UX?

To not only meet, but exceed those expectations in some way.

INTUITIVE DESIGN

CAN I TELL
HOW IT WORKS BY
LOOKING AT IT?

EXAMPLE:
THE OFFICE DOOR

INSIDE

OUTSIDE

INSIDE

PUSH

PUSH

OUTSIDE

PULL

PULL

USERS DON'T
READ

INSIDE

OUTSIDE

User Review

Great door, really like the open feature!

COMMON MOBILE
CONVENTIONS
(THAT WORK)

The Big 3 Navigation systems

BOTTOM TAB

TOP "SWIPE" TABS

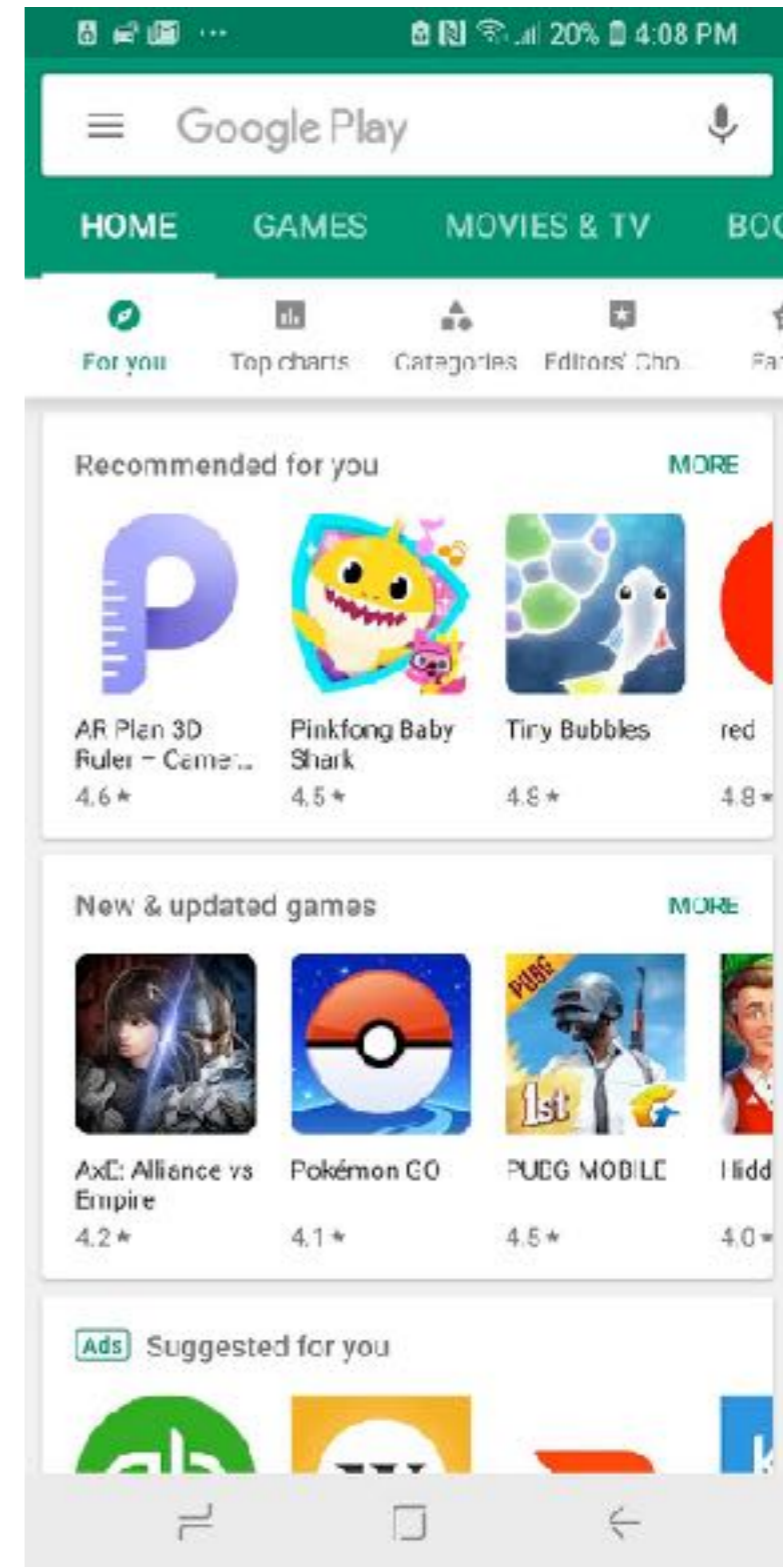

HAMBURGER MENU

Swiping gestures promote discovery

- Always enable swipe gestures when using top layer tabs
- Ideal for navigating through multiple content types
- Carousels help highlight interesting content, and a visually appealing to the user
- **Too much swiping leads to fatigue**

Users scroll, but make it obvious

- Always ensure the screen “fold” sits at the mid point between the page so it’s obvious that they are able to scroll
- Building your screens for scrolling, will make it easier to build for multiple devices sizes

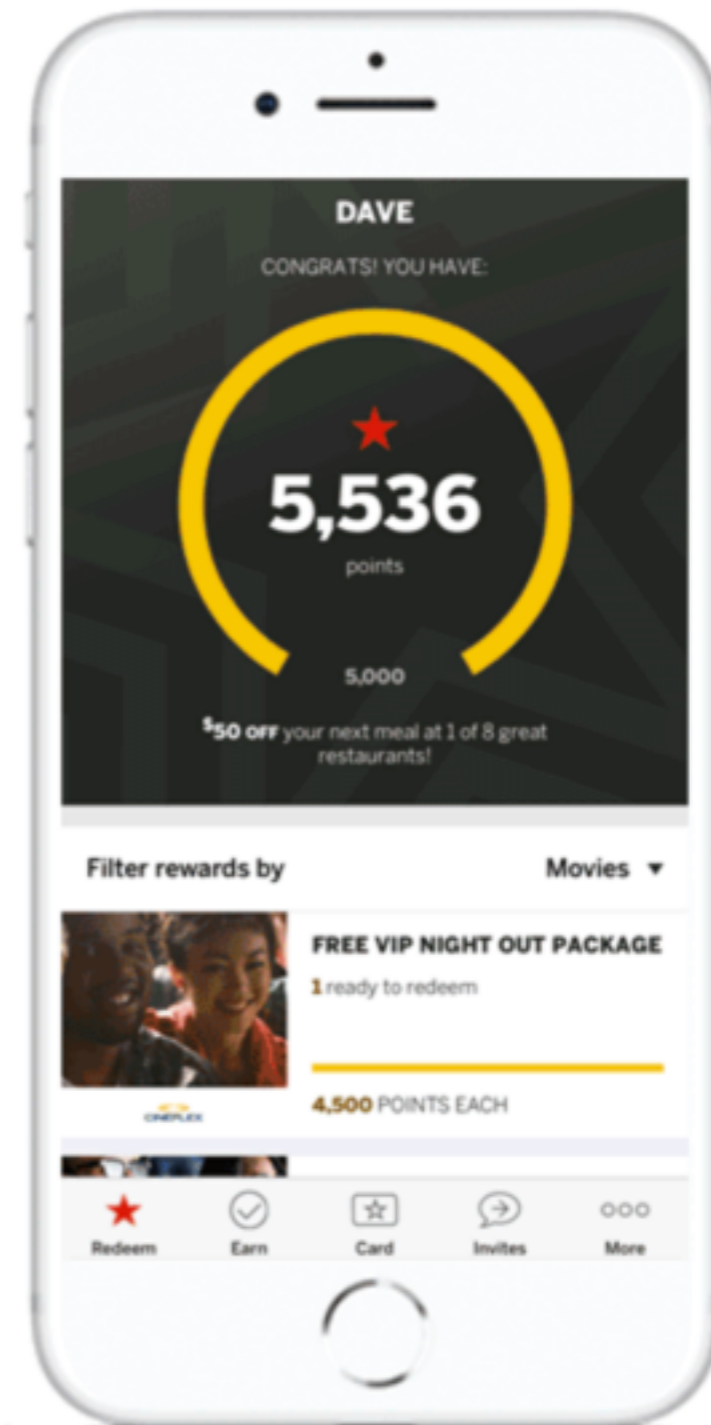

A clean layout is always appreciated

- When designing for mobile less is always more
- Stick to native UI type sizes and always preview and mockups on your phone.
- Beware the word “busy” when showing it to users for testing

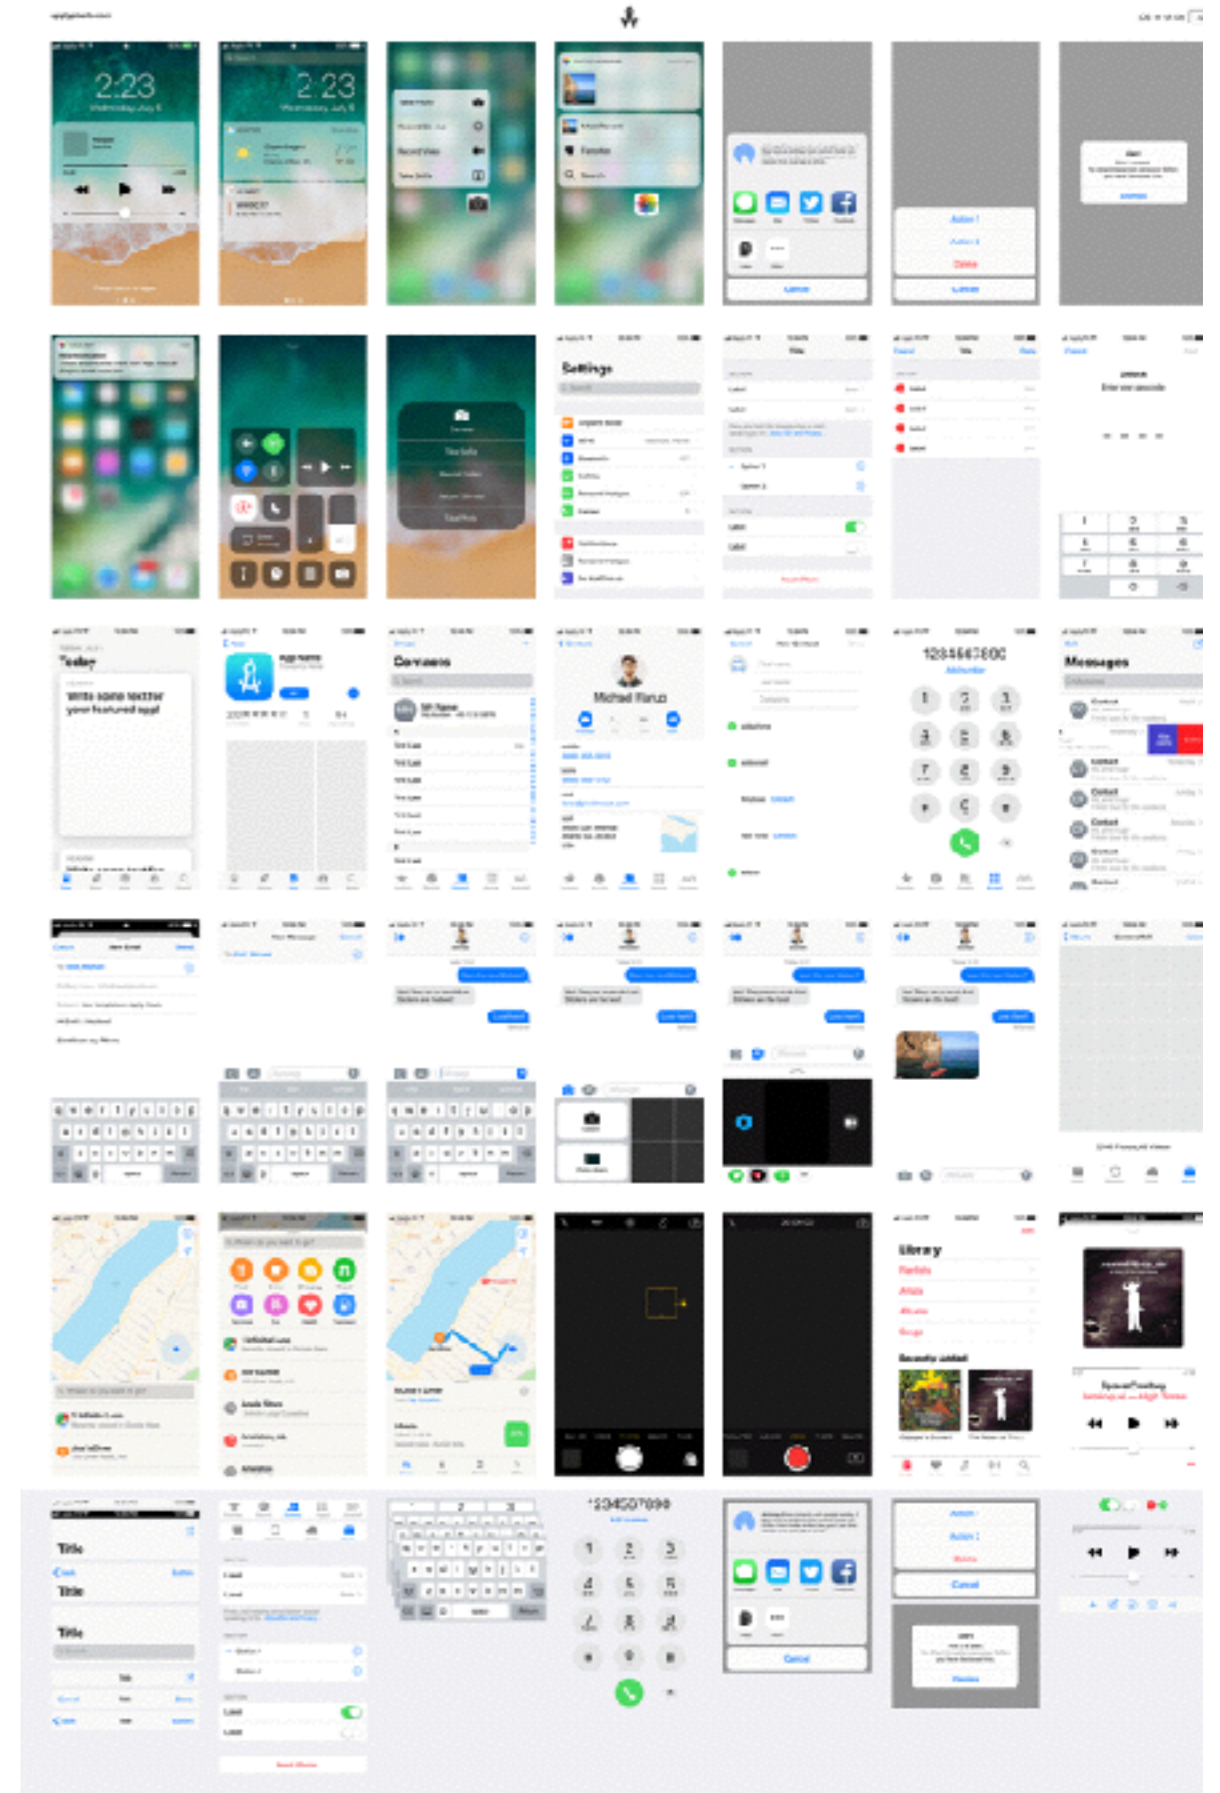

The home screen is your app to the user

- Your home should contain all key features a user would need daily.
- Give your home the greatest amount of time during your UX phase.
- Design for what users will do 95% of the time

Native UI elements work best for typical functions

- For things like forms, fields, selections a user will already be familiar with the way they function.
- Native UI is faster to develop
- Are typically designed for a very specific purpose, and can be confusing if the purpose is altered too much.

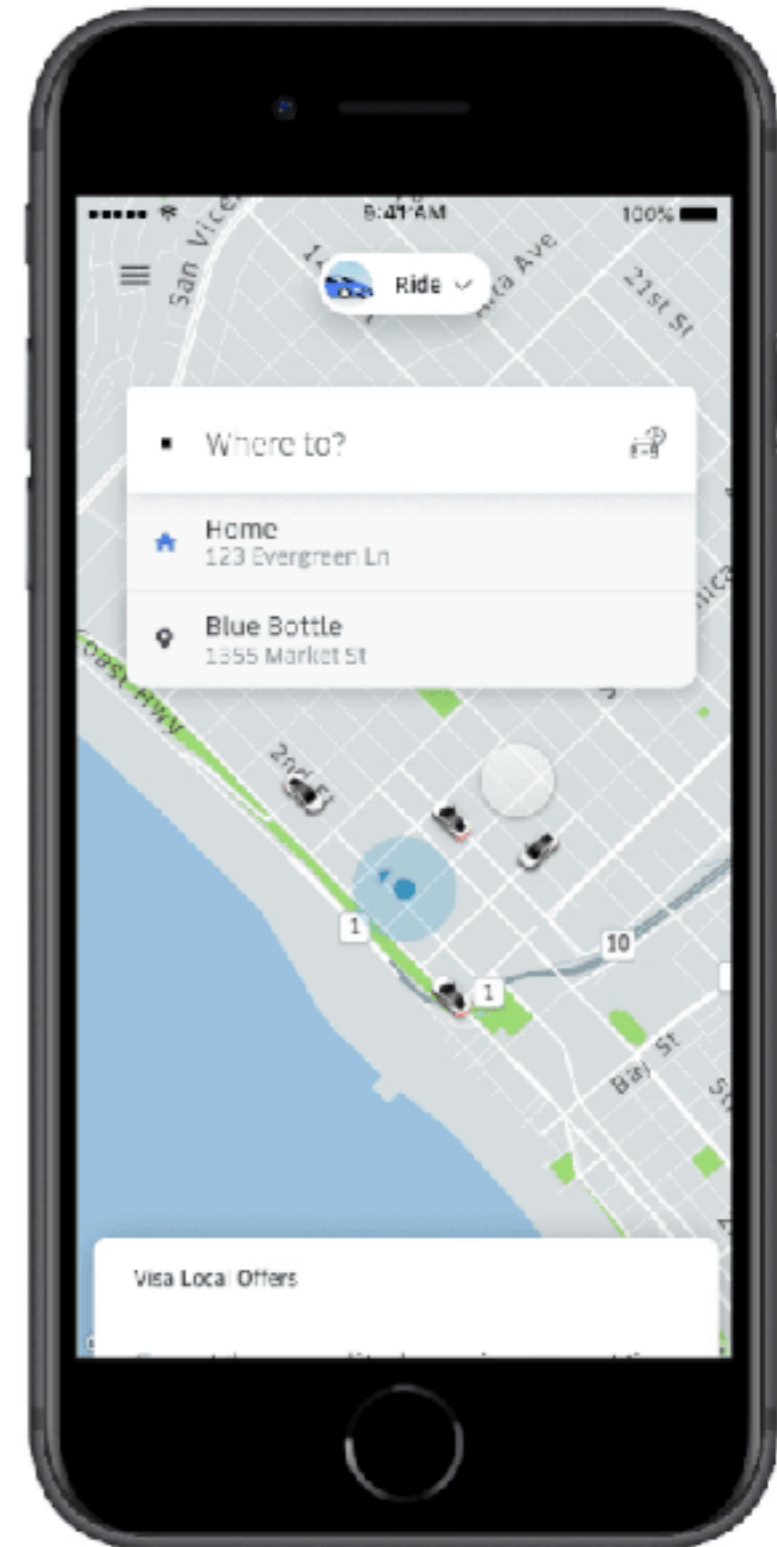

Custom UI works best whenever creating something never seen before

- Ideal when you are creating a feature not currently possible to display in native UI
- For creating a unique interaction for your brand.
- Custom UI takes longer to develop
- Requires much more testing than native

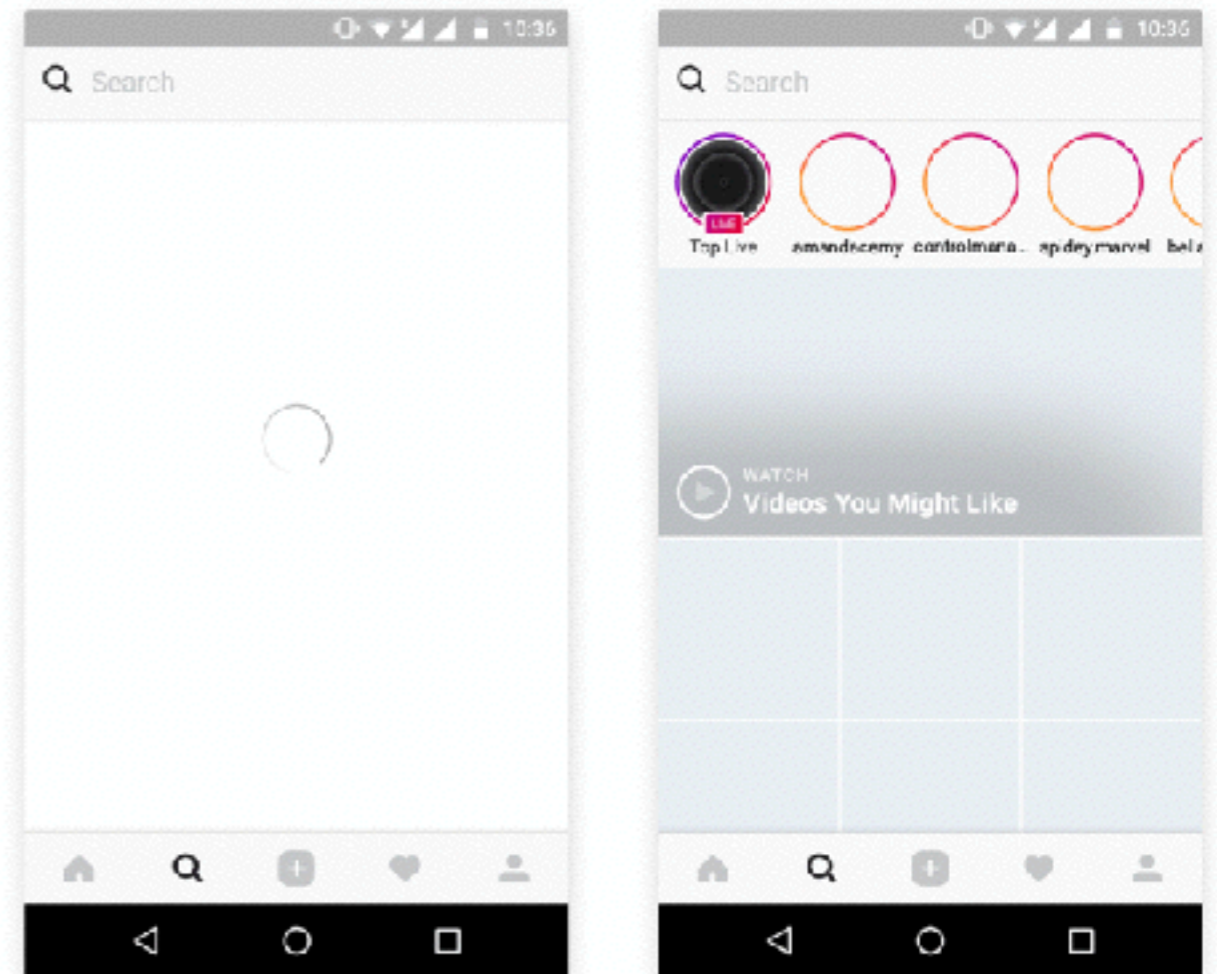

Animation helps users understand custom UI

- Using UI loading animations demonstrates the interaction to the user so they can visually identify the function
- Interaction animations gives your app a greater feeling of responsiveness, and can help mask data loading times.

Loaders let users know the app is always working

- Failure to include a loader will make your app look broken and or appear slow
- If your data may take longer than average, your loader should explain this to the user
- Effort should be made to reduce the amount of loading time needed on every visit (caching)

MOBILE UX PROCESS

STEP 1
DISCOVERY

LEARN THE BUSINESS

- How will they measure success?
- Do they have the technology infrastructure needed?
- Find business insights (how they make money)
- How can mobile add value to their customers?

KNOW THE USER

- Android or iOS? Users expect platform specific interfaces
- Age range/demographic? Will influence the type of language used, imagery and content
- App usage? Heavy users understand native UI very well, while casual may not
- Motivation for using your app?

STEP 2
APP CONCEPTS

Paper Prototypes

- Creating rough, hand sketched, drawings of an interface
- Allows for quick on the fly changes
- Allows for quick informal usability testing in the earliest stages of a project.

High fidelity design

- Created for the initial client presentation
- Establishes the overall design look and feel before moving into any kind of prototyping

PROTOTYPING

Annotated Prototype

TESTING

Webcam

Facilitator's
Computer

Mobile
Testing Sled

Mobile
Application

Test
Participant

Testing your prototypes

- Use a moderator who is not involved with the project, or has little knowledge
- When a test subject asks a question, respond in a way that will cause them to come to their own conclusion - what do you think that button does?
- 5 Test subjects is typically enough per test
- Ensure they always have a chance to explore the prototype without direction, having them speak out loud, describing what they are doing
