Project Proposed	Intelligent Sensory Microsystems Laboratory,
By:	Electrical and Computer Engineering, University of Toronto
Supervisor:	Professor Roman Genov
Project Title:	Exploring Hardware-Efficient Machine Learning Algorithms for Bioelectronic Medicine
	Therapies
Project Description:	Bioelectronic medicine is an emerging field that uses electrical stimulation of nerves or select brain regions, to treat various diseases and disorders, such as diabetes, arthritis, chronic pain, epilepsy, Parkinson's disease, and depression. However, bioelectronic medicine therapies require hardware devices that can perform real-time and accurate machine learning classification of neural signals and deliver optimal stimulation for therapeutic effect.
	A. Neural Circuits and Organ Systems  C. Disease Event Decoding Using Machine Learning

	<ul> <li>This project aims to explore hardware efficient machine learning algorithms that can operate At -the-Edge with low power budget initially on field-programmable gate arrays (FPGAs), with a path towards translation to implantable Application Specific Integrated Circuits (ASICs). The project will involve the following tasks:</li> <li>Reviewing the state-of-the-art machine learning algorithms for bioelectronic medicine, such as deep neural networks (DNN), spiking neural networks (SNN), Reinforcement learning, Transfer learning, etc.</li> <li>Selecting one or more machine learning algorithms that are suitable for hardware implementation and neuromodulation tasks, such as signal classification, feature extraction, or parameter optimization, and implementing it in Software</li> <li>Developing a hardware implementation using Verilog and testing it using FPGAs on simulated or experimental datasets.</li> <li>Evaluating the performance of the machine learning algorithms, and optimizing it for adequate performance.</li> </ul>
	<ul> <li>For this project, we are seeking highly motivated and talented students with a background in ECE, CompEng, or EngSci. They should have knowledge in the following areas (min. GPA: 3.5)</li> <li>Good knowledge of Machine Learning algorithms</li> </ul>
	Experience or interest in Neuromorphic Computing
	<ul> <li>Proficiency in Python, and experience in HDL programming such as Verilog</li> </ul>
	<ul> <li>PCB designing skills using Altium</li> </ul>
	<ul> <li>The Candidate(s) must have a self-driven attitude, ability to debug and solve problems.</li> </ul>
	and ability to work independently.
