

## 4. Analog Adaptive Filters

**Duration:** Half Day

**Tutorial Presenter:**

- o Prof. A. Chan Carusone, University of Toronto, Canada

**Who Should Attend:**

Researchers and designers of digital communication transceivers. This includes people working either at the circuit level (analog, digital, or mixed signal) or the system level. The material would also be of interest to adaptation algorithm researchers.

**Abstract:**

Adaptation is used whenever a filter's parameters must track poorly controlled or time varying conditions. At low speeds, adaptive filtering is easily and efficiently performed using digital circuits. However, analog filters are preferable when high speed, low power operation is required and moderate linearity can be tolerated. In these cases, the combination of flexibility and performance offered by analog adaptive filters can be an enabling technology. This tutorial will provide a overview of the area, including the algorithms, architectures, and circuits.

In the first part of the tutorial, analog filter structures suitable for adaptation are presented. Both analog discrete time (transversal, transpose, IIR) and continuous time (Laguerre and ladder filters) filter structures are covered including first order circuit designs.

The second part of the tutorial is a discussion of adaptation strategies suitable for analog filters. The traditional LMS algorithm has several problems when applied to analog adaptive filters. Algorithmic and circuit techniques for combating these problems will be discussed. Alternative adaptation algorithms will also be presented.

Finally, the third part of the tutorial brings together material presented in the first two sections by focusing on practical applications of analog adaptive filters. Both established applications and ongoing research areas will be considered including magnetic storage read channels, Ethernet transceivers, coaxial cable channels, backplanes, chip-to-chip connections, and optical communications. We shall see how the applications dictate the designers' choice of adaptation strategy, filter structure and circuit implementation.

**Time Table**

<b>Tutorial 4: Analog Adaptive Filters</b>	
13:30	Analog filter structures suitable for adaptation; analog discrete time (transversal, transpose, IIR) and continuous time (Laguerre and ladder filters) filter structures; first order circuit designs
14:30	Adaptation strategies for analog filters; algorithmic and circuit techniques
15:00	Coffee break
15:30	Alternative adaptation algorithms
16:00	Practical applications of analog adaptive filters; magnetic storage read channels, Ethernet transceivers, coaxial cable channels, backplanes, chip-to-chip connections, and optical communications
17:00	Close
18:00	Welcome reception

# **IEEE Int. Symposium Circuits & Systems Tutorial: Analog Adaptive Filters**

**May 25, 2003**

T. Chan Carusone  
University of Toronto  
Dept. of Electrical & Computer  
Engineering

1

## **Outline**

1. Motivation
2. Adaptive Filter Introduction
3. Adaptation algorithms
  - a) LMS adaptation
  - b) LMS variations
  - c) Dc offset effects in the LMS algorithm
  - d) Alternative (non-LMS) adaptation algorithms
4. Filter structures & implementations
  - a) Discrete time
  - b) Continuous time
5. Applications
  - a) Co-axial cable
  - b) Magnetic storage
  - c) High-speed ethernet
  - d) Chip-to-chip communications
  - e) Optical Fibre

## Digital Communications

Why bother with adaptive filters at all?

- Channel impairments are unknown & time-varying

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 3 of 100

## Equalization

- A communication channel changes the shape of pulses passing through it
- Intersymbol interference (ISI)

Challenges:

- only linear channels,  $H(s)$ , can be equalized
- generally requires amplification, hence, noise enhancement
- channel  $H(s)$  may not be known *a priori*  
⇒ Make equalizer adaptive

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 4 of 100

## Echo Cancellation

- *Full duplex*: transmit and receive over the same channel
- Some transmit signal leaks into receive path due to imperfect hybrid circuits
- Echo canceller output should mimic the echo signal

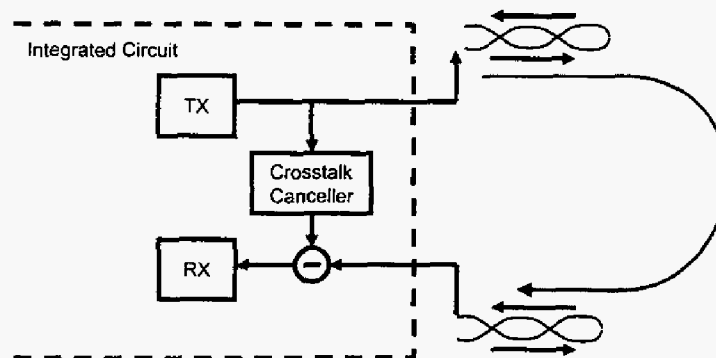

- Challenges: similar to equalizer

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

Slide 5 of 100

## Crosstalk Cancellation

- transmit signal from **neighboring channel** leaks into receive path
- Crosstalk canceller mimics the coupling path

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

Slide 6 of 100

## Digital Communications

Why bother with *analog* adaptive filters?

- **Case #1:** Very high speed required
  - ⇒ A/D conversion not possible or practical
- **Case #2:** Moderate linearity & low power required
  - ⇒ Possible power savings resulting from reduction in A/D resolution and/or DSP required
  - ⇒ Improvement may be debateable as CMOS process technologies scale

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 7 of 100

## Digital Communications

**Example #1:** Adaptive equalization of 10+ Gb/s data

- A/D must operate at 10+ GSamples/sec with several bits accuracy
  - ⇒ huge power consumption
  - ⇒ may not even be feasible, especially in CMOS

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 8 of 100

## Digital Communications

### Example #1: Adaptive equalization of 10+ Gb/s data

- no need for A/D
- may be implemented at the transmitter

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

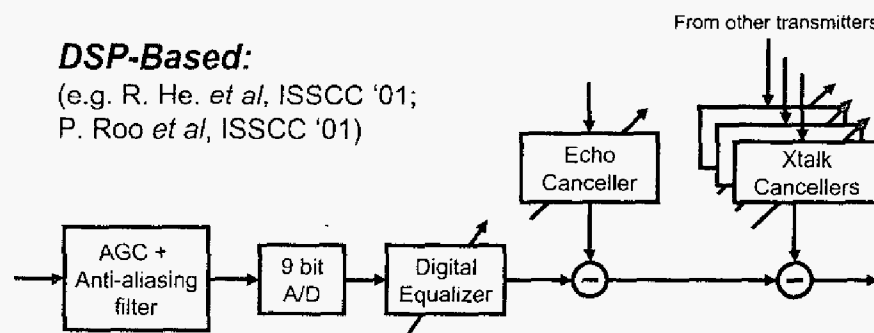

Slide 9 of 100

## Analog vs. Digital Adaptive Filters

### Example #2: Signal conditioning in Gigabit ethernet

#### **DSP-Based:**

(e.g. R. He. *et al*, ISSCC '01;  
P. Roo *et al*, ISSCC '01)

- Lots of high-speed DSP  $\Rightarrow$  power-hungry
- Considerable analog front end still required
- 9-bit A/D design is challenging

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

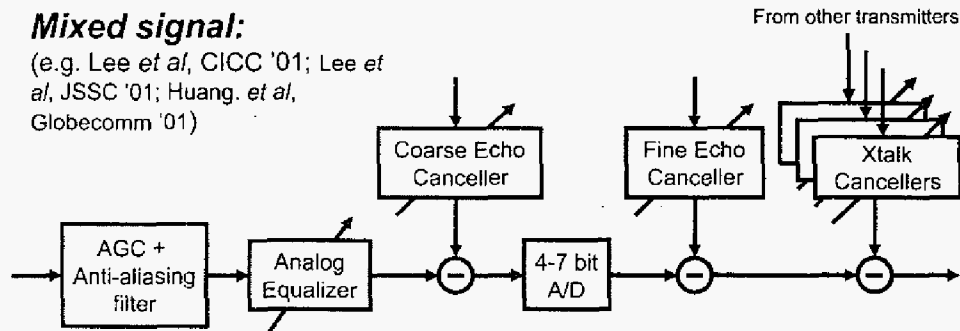

Slide 10 of 100

## Analog vs. Digital Adaptive Filters

### Example #2: Signal conditioning in Gigabit ethernet

#### Mixed signal:

(e.g. Lee *et al*, CICC '01; Lee *et al*, JSSC '01; Huang. *et al*, Globecomm '01)

- Analog equalizer may be combined with anti-aliasing filter
- Reduced power in both DSP and A/D
- Overall analog complexity may actually be *reduced*

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 11 of 100

## Outline

1. Motivation
2. Adaptive Filter Introduction
3. Adaptation algorithms
4. Filter structures & implementations
5. Applications

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 12 of 100

## Adaptive Filter Introduction

- Adaptive filter has input  $u$  and output  $y$
- The filter has programmable parameters,  $p$  (e.g. transfer function coefficients, location of poles, zeros, etc...)
- The filter's "desired" or "ideal" output is known,  $d$
- Adaptation algorithm adjusts  $p$  to minimize the power in the error,  $e = d - y$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 13 of 100

## Adaptive Filter Introduction

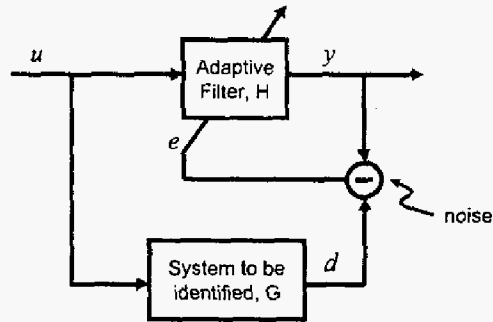

Alternate interpretation:

- Adaptation algorithm adjusts  $p$  so that  $y$  is the best possible estimate of  $d$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 14 of 100

## System Identification Model

- Define:
  - $u$  = filter input
  - $y$  = filter output
  - $d$  = desired output
  - $e$  = error in output with respect to desired output =  $(d - y)$
- After convergence,  $H$  will match  $G$  as closely as possible  $\Rightarrow$  can then use  $H$  as a model for  $G$  (a.k.a. "model matching")

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 15 of 100

## Example: Equalization

- Desired output,  $d$  = transmitted waveform
- Must have access to the transmitted data at the receiver in order to generate  $e$  (e.g. training sequence)
- Similar to the system identification problem except the system to be identified,  $G = (\text{channel})^{-1}$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 16 of 100

## Decision-Directed Equalization

- Instead, may use receiver's decisions as the "desired" signal
  - "Decision-directed" operation
  - Assumes fairly low bit error rate (BER)
  - May use training sequence at the start to decrease BER, then switch to decision-directed

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 17 of 100

## Adaptive Pre-emphasis

- (Theoretically) it does not matter what order you apply the adaptive filter and the channel
  - Sometimes it is beneficial to apply adaptive filtering at the transmitter: "Pre-emphasis" (usually high frequency components are amplified/emphasized prior to transmission)

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 18 of 100

## Example: Echo Cancellation

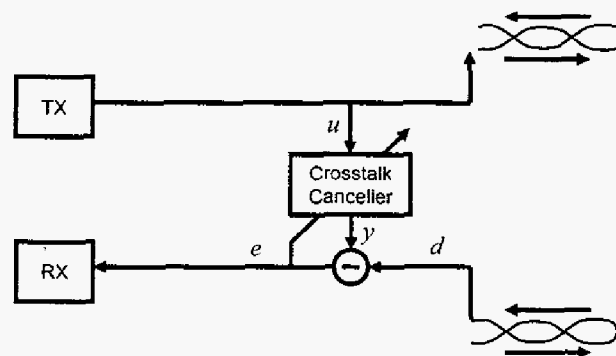

- Recall:

- $u$  = filter input
- $y$  = filter output
- $d$  = desired output
- $e$  = error in output with respect to desired output =  $(d - y)$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 19 of 100

## Example: Crosstalk Cancellation

- Recall:

- $u$  = filter input
- $y$  = filter output
- $d$  = desired output
- $e$  = error in output with respect to desired output =  $(d - y)$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 20 of 100

## Outline

1. Motivation
2. Adaptive Filter Introduction
3. **Adaptation algorithms**
  - a) LMS adaptation
  - b) LMS variations
  - c) Dc offset effects in the LMS algorithm
  - d) Alternative (non-LMS) adaptation algorithms
4. Filter structures & implementations
5. Applications

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 21 of 100

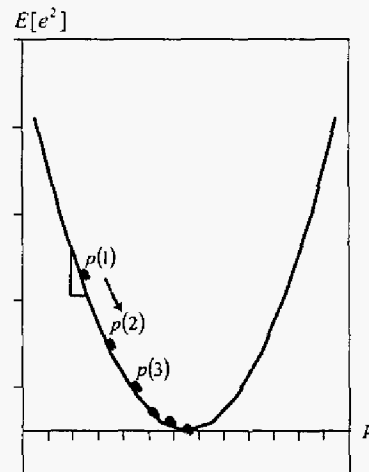

## Gradient Descent Adaptation

- 1 parameter case:

$$\frac{\partial E[e^2]}{\partial p} < 0 \quad \therefore \Delta p > 0$$

$$\begin{aligned} \Rightarrow p(k+1) &= p(k) + \Delta p \\ &= p(k) - \mu \frac{\partial E[e^2(k)]}{\partial p} \end{aligned}$$

- $\mu$  determines the rate of adaptation: larger  $\mu \Rightarrow$  faster convergence

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 22 of 100

## Gradient Descent Adaptation

- Multiple parameters: Each is updated independently (simultaneously) depending on its own partial derivative
- e.g. 2 parameters:

$$p_1(k+1) = p_1(k) - \mu \frac{\partial E[e^2(k)]}{\partial p_1} \quad p_2(k+1) = p_2(k) - \mu \frac{\partial E[e^2(k)]}{\partial p_2}$$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 23 of 100

## Gradient Descent Adaptation

- $\mu$  must also be chosen to ensure stability

$\mu$  underdamped, but still stable

$\mu$  too large  $\Rightarrow$  unstable

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 24 of 100

## Gradient Descent Adaptation

- Usually,  $\mu$  is chosen conservatively for smooth “overdamped” convergence

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 25 of 100

## Gradient Descent Adaptation

- $\mu_{\max}$   $\approx$  maximum  $\mu$  for which adaptation is still stable
- > will depend upon the shape of the performance surface
- “shallow” bowl  $\Rightarrow$  larger  $\mu_{\max}$  since the slope  $\delta E[e^2(k)]/\delta p$  is always smaller

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 26 of 100

## Gradient Descent Adaptation

- With multiple parameters, must choose  $\mu$  conservatively for worst-case (steepest) parameter
- In this case, using the same  $\mu$  for both parameters results in a  $\mu$  that is slower than necessary for  $p_1$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 27 of 100

## Gradient Descent Adaptation

- How can we calculate  $\partial E[e^2]/\partial p$ ?
  - Operate filter at  $(p + \Delta p)$  and  $(p - \Delta p)$  for some period of time,  $T_0$
  - Average  $e^2$  over  $T_0$  to estimate  $E[e^2]$  at  $(p + \Delta p)$  and  $(p - \Delta p)$
  - Approximate: 
$$\frac{\partial E[e^2]}{\partial p} \approx \frac{E[e^2]_{|_{p+\Delta p}} - E[e^2]_{|_{p-\Delta p}}}{\Delta p}$$
  - Problem: only becomes accurate for large  $T_0 \Rightarrow$  slow/inaccurate

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 28 of 100

## LMS Algorithm

- How can we calculate  $\partial E[e^2]/\partial p$ ?

➤ Assume that  $E[e^2(k)] \approx e^2(k)$

$$\therefore \frac{\partial E[e^2]}{\partial p} \approx \frac{\partial(e^2)}{\partial p} = \frac{\partial(e^2)}{\partial e} \cdot \frac{\partial e}{\partial p} = 2e \cdot \frac{\partial(d-y)}{\partial p} = -2e \cdot \frac{\partial y}{\partial p} \equiv -2e\phi$$

- $\phi$  is the "gradient signal" for parameter  $p$
- Substitute this back into general gradient descent method:

$$p(k+1) = p(k) + 2\mu e(k)\phi(k) \quad \text{LMS Algorithm}$$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 29 of 100

## LMS Algorithm

- **Problem:** What is the effect of the approx:  $\delta E[e^2(k)]/\delta p \approx -2e\phi$ ?
- After convergence,  $\delta E[e^2(k)]/\delta p = 0$  but  $-2e\phi \neq 0$
- So,  $\Delta p(k) \neq 0$  and parameters "bounce" around their optimal values

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 30 of 100

# LMS Algorithm

- **Exception:** If the adaptive filter can be made to match the "target" exactly  $\Rightarrow y = d \Rightarrow e = 0 \Rightarrow -2e\phi = 0 \Rightarrow \Delta p(k) = 0$

- Never occurs in practice

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 31 of 100

# LMS Algorithm

- The amount of "bounce" can be reduced by decreasing  $\mu$
- The amount of bounce is the "*misadjustment*"

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 32 of 100

## LMS Algorithm

- Tradeoff between speed and accuracy of convergence in choice of  $\mu$

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 33 of 100

## LMS Algorithm

- Compromise can be reached by employing "gear-shifting" approach

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 34 of 100

## Obtaining Gradient Signals

- **Problem:** How can we obtain  $\phi$ ?
- Depends upon the filter structure employed:
  - Adapt only zeros while keeping poles fixed  
⇒ “adaptive linear combiner” (usual case)
  - Adapt poles and zeros  
⇒ “adaptive IIR filtering” (challenging!)

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 35 of 100

## Adaptive Linear Combiner (ALC)

- Each block,  $g_i$ , represents a fixed LTI system
- Adapted parameters are the coefficients,  $p_i$
- Changing  $p_i$ 's only effects the filter's zeros (not the poles) ⇒ always stable
- Overall impulse response & transfer function from  $u$  to  $y$ :

$$y(k) = p_1 x_1(k) + \dots + p_N x_N(k)$$

$$= \sum_{i=1}^N p_i x_i(k)$$

$$h(k) = p_1 g_1(k) + \dots + p_N g_N(k) = \sum_{i=1}^N p_i g_i(k)$$

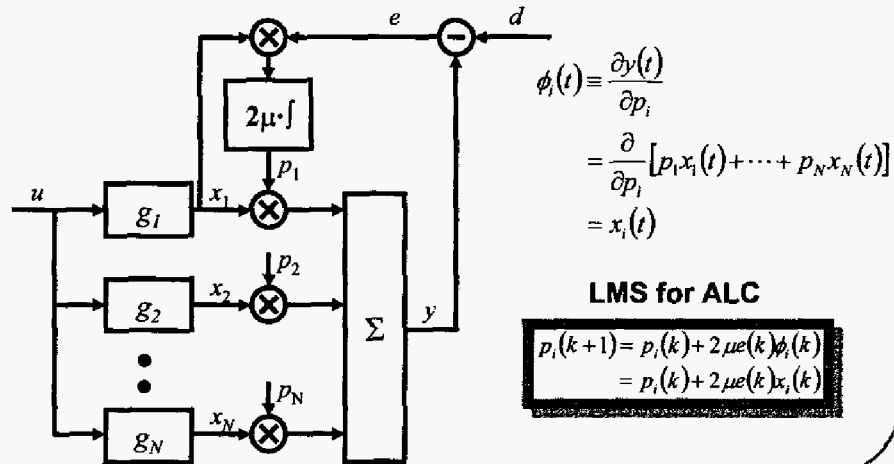

$$H(z) = \sum_{i=1}^N p_i G_i(z)$$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 36 of 100

## Adaptive Linear Combiner

- Problem: How can we obtain  $\phi$ ?

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 37 of 100

## Adaptive Linear Combiner

- Matrix notation:  $\bar{p} = \begin{bmatrix} p_1 \\ p_2 \\ \vdots \\ p_N \end{bmatrix}, \bar{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_N \end{bmatrix} \Rightarrow \bar{p}(k+1) = \bar{p}(k) + 2\mu e(k)\bar{x}(k)$

Let,  $\xi = E[e^2]$  Note:  $\xi = \xi(\bar{p})$  is the "performance surface"

Let,  $\xi(\bar{p}^*) = \xi_{\min}$ , where  $\bar{p}^*$  are the optimal ALC coefficients

- It can be shown that:

$$\xi(\bar{p}) = \xi_{\min} + (\bar{p} - \bar{p}^*)R(\bar{p} - \bar{p}^*)^T$$

- Where  $R$  is the  $N \times N$  state correlation matrix:  
 $R_{ij} = E[x_i(k) \cdot x_j(k)]$
- $\xi$  is a N-dimensional paraboloid

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 38 of 100

## Adaptive Linear Combiner

- The shape of  $\xi(p)$  is related to the state correlations,  $E[x_i(k) \cdot x_j(k)]$
- Independent states  $\Rightarrow$  a "round bowl"  $\Rightarrow$  fast convergence of all parameters
- Dependent states  $\Rightarrow$  "ill-conditioned" performance surface  $\Rightarrow$  poor convergence
- e.g. 2 parameters with highly dependent states:

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 39 of 100

## Adaptive Linear Combiner

- ALCs have several advantages:
  - ✓ Stability of the filter is guaranteed because the pole locations are fixed
  - ✓ The MSE is a parabolic function of the parameters; hence, there is only one local minimum; stability of the adaptation procedure is guaranteed using a gradient descent algorithm (such as LMS)
  - ✓ Relatively easy to obtain the gradient signals,  $\phi$ , required for LMS adaptation

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 40 of 100

## Analog Transversal Filters

- **Example: Analog transversal filter**

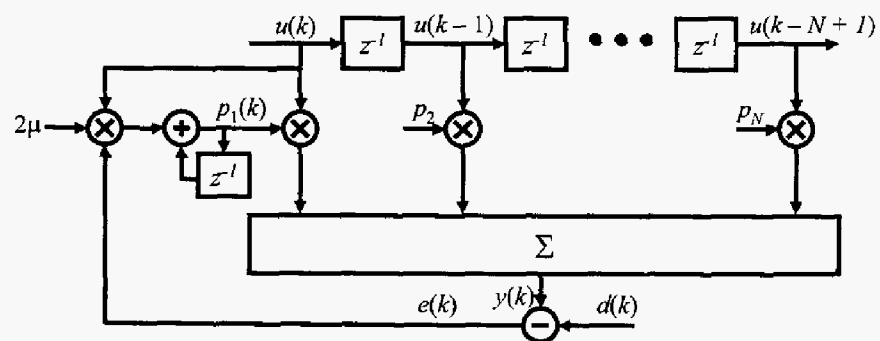

- **$N$ -parameter FIR filter**

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 41 of 100

## Analog Transversal Filters

- If  $u(k)$  is white,  $E[u(k)u(k-i)] = 0, \forall i \neq 0 \Rightarrow E[x_i(k)x_j(k)] = 0, \forall i \neq j$
- The states are uncorrelated
- **LMS adaptive transversal filter:**

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 42 of 100

## Adaptive IIR Filtering

- In general, one may adapt the zeros and poles of a filter
- ✓ May provide better performance with fewer adapted parameters
- × Poles may become unstable
- × Convergence to the optimum filter parameters is not guaranteed using gradient descent techniques (e.g. the LMS algorithm)
- × More difficult to obtain the gradient signals,  $\phi$ , for LMS adaptation

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 43 of 100

## Adaptive IIR Filtering

- "Multi-modal" performance surface
- Steady-state parameters depend upon the initial conditions
- No guarantee that you will converge to the optimal parameters
- Note: For ALC, you are guaranteed a (N-dimensional) parabolic performance surface  $\Rightarrow$  "unimodal"

$$\xi(p) = E[e^2]$$

$$\xi_{\text{ALC}}(\bar{p}) = \xi_{\text{min}} + (\bar{p} - \bar{p}^*)R(\bar{p} - \bar{p}^*)^T$$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 44 of 100

## Adaptive IIR Filtering

- **Problem:** How can we calculate  $\phi$  for an IIR filter parameter?

$$\begin{aligned}
 y &= b * h_{by} + [\text{other terms that don't depend on } b] \\
 &= p \cdot a * h_{by} + \dots \\
 &= p \cdot u * h_{ua} * h_{by} + \dots
 \end{aligned}$$

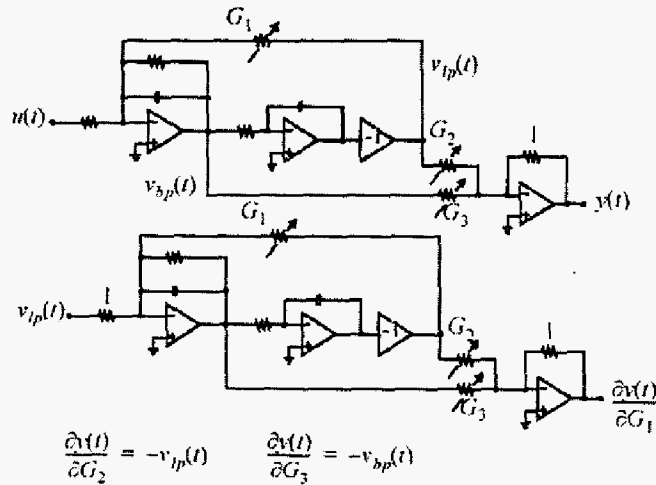

$$\therefore \frac{\partial y}{\partial p} = u * h_{ua} * h_{by}$$

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 45 of 100

## Adaptive IIR Filtering

- **Example:**

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 46 of 100

## LMS Algorithm Implementation

- LMS update rule can be implemented using either analog or digital circuits
- For digital filters, use digital LMS:

$$p_i(k+1) = p_i(k) + 2\mu e(k)\phi_i(k)$$

Analog Adaptive Filters  
Prof. T. Chen Carusone, University of Toronto

Slide 47 of 100

## LMS Algorithm Implementation

- For analog filters, analog implementation may seem natural/obvious:

$$p_i(t) = 2\mu \int e(\tau)\phi_i(\tau)d\tau$$

Analog Adaptive Filters  
Prof. T. Chen Carusone, University of Toronto

Slide 48 of 100

## LMS Algorithm Implementation

- **Problem:** dc offsets on the gradient and error signals hinder the adaptation  $\Rightarrow$  always present on analog signals

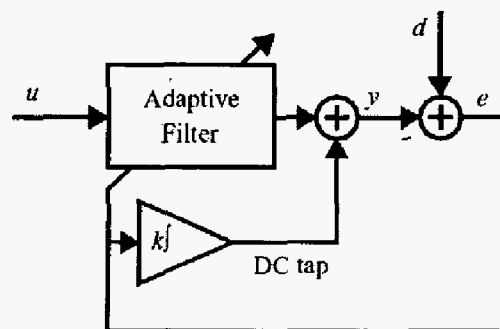

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 49 of 100

## LMS Algorithm Implementation

- **Solution:** dc offsets on the error signal can be eliminated by a dc tap
- Other sources of offset remain

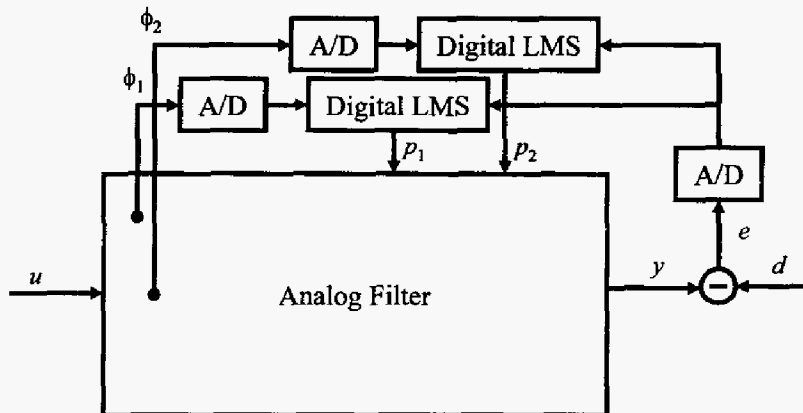

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 50 of 100

## LMS Algorithm Implementation

- **Solution:** use digital adaptation
- **Problem:** too much hardware!

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 51 of 100

## LMS Algorithm Implementation

- **Solution:** use simplified adaptation algorithms
- Any monotonic function can be applied to  $e$  or  $\phi_i$  and still move  $p_i$  in the correct direction

$$\text{LMS: } p_i(k+1) = p_i(k) + 2\mu \cdot e(k) \cdot \phi_i(k)$$

$$\text{Sign - data LMS: } p_i(k+1) = p_i(k) + 2\mu \cdot e(k) \cdot \text{sgn}(\phi_i(k))$$

$$\text{Sign - error LMS: } p_i(k+1) = p_i(k) + 2\mu \cdot \text{sgn}(e(k)) \cdot \phi_i(k)$$

$$\text{Sign - sign LMS: } p_i(k+1) = p_i(k) + 2\mu \cdot \text{sgn}(e(k)) \cdot \text{sgn}(\phi_i(k))$$

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 52 of 100

## LMS Algorithm Implementation

➤ Much simpler hardware

LMS

SS-LMS

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 53 of 100

## LMS Algorithm Implementation

- **Problem:** slower adaptation and risk of instability
- **Example:** Gradient estimates for LMS & SS-LMS

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 54 of 100

## Alternate Adaptation Algorithms

- **Example #1:** look at transitions and adjust the amount of high-freq boost in the equalizer for,
  - zero overshoot/undershoot [Everitt '98]
  - certain maximum slope [Shoval '95]

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 55 of 100

## Alternate Adaptation Algorithms

- Due to these difficulties, some people have implemented other adaptation approaches
- **Example #2:** Look at relative attenuation of high/low frequencies and program equalizer to compensate for the difference

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 56 of 100

## Alternate Adaptation Algorithms

### Example #3: "Zero-Forcing" algorithm

[Lucky, '65]

$$p(k+1) = p(k) + 2\mu e(k)y(k)$$

- ✓ Does not require access to gradient signals
- ✗ Does not minimize mean-squared error  $\Rightarrow$  causes noise enhancement

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

Slide 57 of 100

## Alternate Adaptation Algorithms

- Example #4: Dither parameters and look for correlated changes in the output squared error [Chan Carusone, '02]

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

Slide 58 of 100

## Outline

---

1. Motivation
2. Adaptive Filter Introduction
3. Adaptation algorithms
4. **Filter structures & implementations**
  - a) **Discrete time**
    - i. Transversal
    - ii. Other
  - b) **Continuous time**
    - i. Transversal
    - ii. Cascade of biquads
    - iii. Ladder
5. Applications

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 59 of 100

## Discrete Time Filters

---

- Discrete-time basic building blocks:
  1. Delay stage
  2. Multiply or Programmable Gain
  3. Summation
- Example: Transversal Filter

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 60 of 100

## Discrete Time Filters

1. Delay stage: sample and hold circuits
  - Based on holding a voltage on a capacitor:

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 61 of 100

## Analog Filter Implementation

- Can create a delay-line using this approach:

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 62 of 100

## Discrete Time Filters

2. Programmable Gain: can be realized by varying the size of the holding capacitors
  - If capacitors are digitally programmable, gain can be digitally programmable [Gomez, '93]

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 63 of 100

## Discrete Time Filters

2. Programmable Gain: alternately, can multiply 2 analog quantities together via a Gilbert cell
  - Requires the filter parameter value to be an analog voltage [Kiriaki, '97]

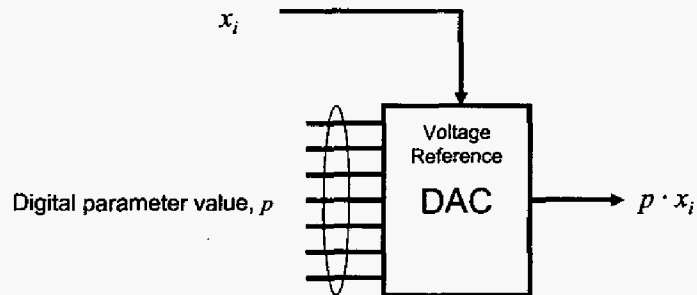

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 64 of 100

## Discrete Time Filters

2. Programmable Gain: can use a multiplying digital-to-analog converter, MDAC

## Discrete Time Filters

3. Summation: easiest and fastest way is to use current signals, then simply tie them together

## Analog Transversal Filter

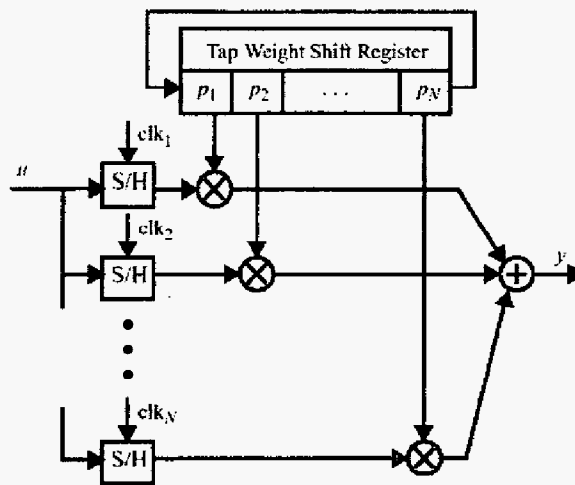

- Straightforward implementation:

- **Problems:**
  - DC offsets, noise, etc. introduced by each S/H accumulate as the signal progresses along the chain
  - Each S/H must operate at the full sampling rate

## Analog Transversal Filter

- **Solution:** rotating tap weights [Haque '77], [Ahuja '79]
- **Problem:** at high speed, the dynamic power consumption of shifting the tap coefficients around becomes large

## Analog Transversal Filter

- **Solution:**  
rotating switch matrix  
[Sonntag '95]

- **Problem:**  
mismatch between different S/Hs show up as fixed pattern noise at the output

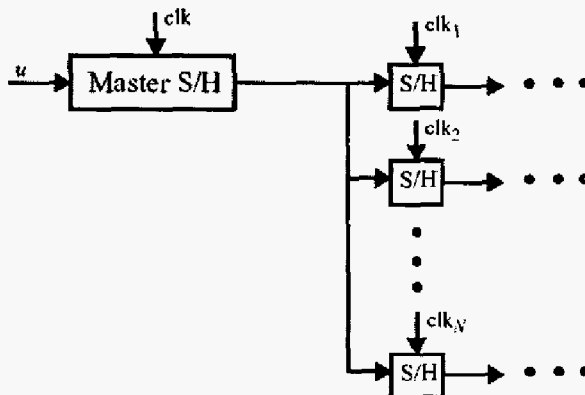

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

Slide 69 of 100

## Analog Transversal Filter

- **Solution:**  
master S/H at front end  
[Kiriaki '97]

- **Problem:**  
S/H must operate at the full sampling rate

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

Slide 70 of 100

## Discrete Time Filters

- Other discrete time structures possible
- **Example:** lattice filters have desirable properties for adaptive filters
- IIR, but stability can be guaranteed by ensuring  $|k_i| < 1$
- Same analog building blocks
- Have not been common in practice

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 71 of 100

## Continuous Time Filters

- Active filters preferred for integrated circuits
- Continuous time filter building blocks:
  - Integrator
  - Multiplier or Programmable Gain
  - Summation: usually use current summation for high-speed, as before

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 72 of 100

## Continuous Time Filters

- **Integrators:** two main types
- In both cases, input voltage is converted into a current, then integrated on a capacitor

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 73 of 100

## Continuous Time Filters

- **Multiplier / Programmable Gain**
  1. Can use a Gilbert cell as before
  2. Can use a programmable gain stage
    - may even combine with the integrator
    - Example: Gm-C integrator with programmable gain

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 74 of 100

## Continuous Time Filters

- Many options for filter structures
- **Example: Laguerre Filter Structure**
  - Special case of ALC (guaranteed stable, easy LMS adaptation, fixed zero locations, etc...)

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 75 of 100

## Continuous Time Filters

- Essentially a continuous time tapped delay line [Sands, '96], [Parsi, '96]
- Instead of first-order allpass delay elements (as in Laguerre structure), one can also use Bessel allpass delay stages

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 76 of 100

## Continuous Time Filters

- Could also use a biquad with adaptive  $\omega_0$  &  $Q$  (e.g. [Shoval '95]):

$$H(s) = \frac{a_2 s^2 + a_1 s + a_0}{s^2 + \frac{\omega_0}{Q} s + \omega_0^2}$$

- ✓ Easy to build
- ✓ Easy to adapt while maintaining stability (usually using "alternate" non-LMS algorithms)
- ✗ Limited to 2<sup>nd</sup> order transfer functions
  - Cascade adaptive biquads to get higher order transfer functions
- ✗ May have problems with dynamic range scaling

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 77 of 100

## Continuous Time Filters

- Orthonormal ladder filter structure
- ✓ Arbitrary rational transfer function
- ✓ Good dynamic range scaling
- ✗ Difficult to obtain gradient signals

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 78 of 100

## Outline

1. Motivation
2. Adaptive Filter Introduction
3. Adaptation algorithms
4. Filter structures & implementations
5. Applications
  - a) Co-axial cable
  - b) Magnetic storage
  - c) High-speed ethernet
  - d) Chip-to-chip communications
  - e) Optical Fibre

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 79 of 100

## Co-axial Cable

- **Application:** high-speed point-to-point links
- Channel transfer function:  $H(s) = e^{-aL\sqrt{s}}$
- ISI can be cancelled using inverse of channel response:  $H^{-1}(s) = 1/H(s)$
- Approximate,  $H^{-1}(s) = e^{aL\sqrt{s}} \cong 1 + b \cdot Y(s)$   
where  $Y(s)$  is fixed with +10 to +12 dB/decade slope

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 80 of 100

## Co-axial Cable

- **Equalizer examples:** [Hartman '99], [Shakiba '99]
- $b$  is adapted via a LMS or other algorithm
- ⇒ An adaptive linear combiner
- × Must be careful to avoid boosting noise too much
- ⇒ Practical implementations have a limited bandwidth

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 81 of 100

## Magnetic Storage

➤ Partial Response Signal!

Analog Adaptive Filters  
 Prof. T. Chan Carusone, University of Toronto

Slide 82 of 100

## Magnetic Storage

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 83 of 100

## Magnetic Storage

- Equalization #1: Analog discrete time
- Examples: [Xu '96], [Kiriaki '97], [Wang '98]

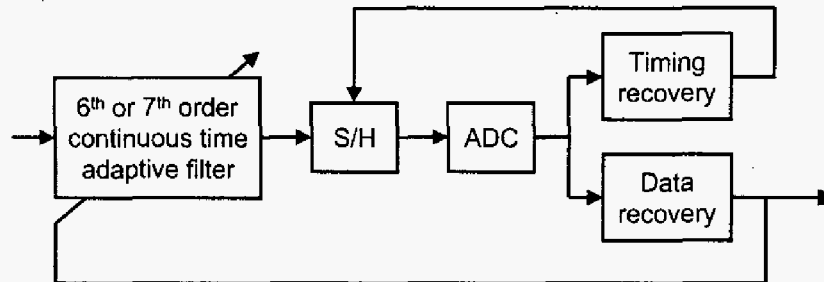

- Switched capacitor transversal filters with rotating tap weights or rotating switch matrix
- SS-LMS (digital) adaptation
- ✓ Robust and simple adaptation

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 84 of 100

## Magnetic Storage

- **Equalization #2:** Analog continuous time
- Examples: [Pai '96], [Brown '99]

- Continuous time ladder structures with adapted zeros
- SS-LMS (digital) adaptation
- ✓ Generally lower power & smaller area at high speeds

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

Slide 85 of 100

## Magnetic Storage

- **Equalization #3:** Digital

- ✓ Robust and simple adaptation
- ✓ Scales well

*Analog Adaptive Filters*  
Prof. T. Chan Carusone, University of Toronto

Slide 86 of 100

## Gigabit Ethernet over Copper

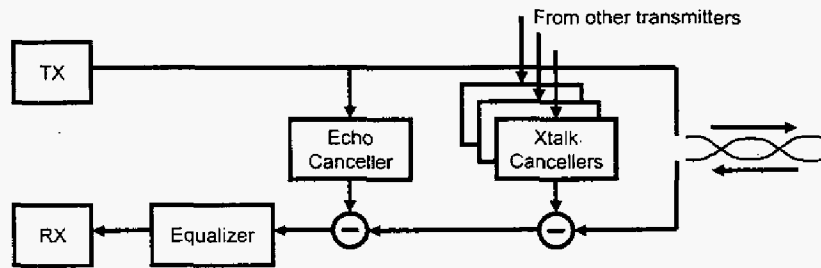

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 87 of 100

## Gigabit Ethernet over Copper

### Challenges:

- Elimination of ISI, echo, crosstalk
- Integration of entire transceiver with reasonable power & cost

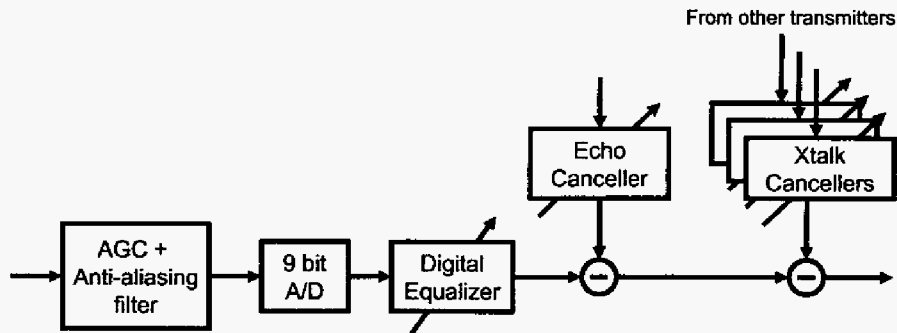

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 88 of 100

## Analog vs. Digital Adaptive Filters

DSP based: [He '01], [Roo '01]

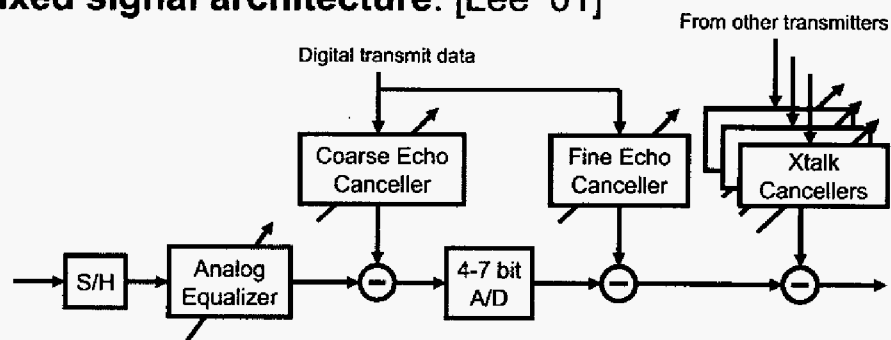

- Lots of high-speed DSP  $\Rightarrow$  power-hungry
- Considerable analog front end still required
- 9-bit A/D design is challenging

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 89 of 100

## Analog vs. Digital Adaptive Filters

Mixed signal architecture: [Lee '01]

- S/H based transversal equalizer with rotating tap weights
- Digital SS-LMS adaptation using DACs for the tap weights
- Echo canceller accepts digital inputs from transmit path
- A "rover" tap in the echo canceller eliminates distant echoes

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 90 of 100

## Chip-to-chip communication

- Usually consists of sending information from one IC to another over PCB traces and (possibly) connectors

- > Attenuation (conductor losses)
- > Intersymbol interference (limited bandwidth)
- > Reflections/echoes (mismatches at connectors and termination)
- > Crosstalk (from neighbouring channels)

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 91 of 100

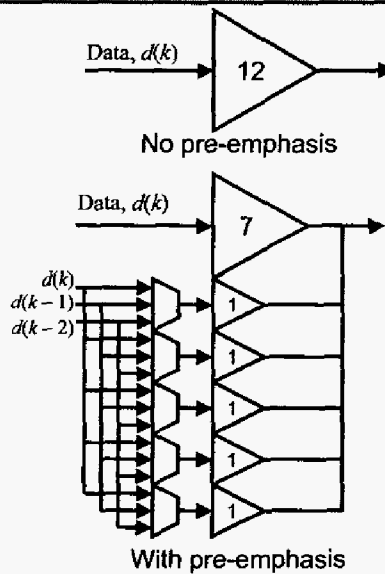

## Chip-to-chip communication

- Most popular approach is adaptive pre-emphasis at transmitter

**Example:**

$$a_0 + a_1z^{-1} + a_2z^{-2}$$

- > Minimal additional hardware

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 92 of 100

## Chip-to-chip communication

- Crosstalk cancellation is similarly possible at the transmitter; e.g. [Zerbe '01]
- Challenge is performing adaptation, which requires information from the receiver [Stonick '03]
- Current research & development is directed at receive-side equalization

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 93 of 100

## Optical Fiber

- Different colors (wavelengths) of light propagate along fiber at different velocities  $\Rightarrow$  "Chromatic dispersion"
- Causes pulses to spread out  $\Rightarrow$  Intersymbol Interference

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 94 of 100

## Optical Fiber

- Imperfections in the fiber cause light with different polarizations to propagate with different speeds: "Birefringence" or "Polarization mode dispersion"

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 95 of 100

## Optical Fiber

- Multimode fiber supports multiple modes of light propagation, each with a different velocity resulting in many received pulses of light with different amplitudes
- Bandwidth limitations of the receiver front-end smear together pulses into one Gaussian electrical pulse

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto

Slide 96 of 100

## Optical Fiber

- Can be cancelled using equalization (a.k.a. "Dispersion compensation") [Azadet '02]
- **Example:** [Wu '03], 10 Gb/s

- Continuous time tapped delay line
- Delay elements are passive LC networks

Analog Adaptive Filters  
Prof. T. Chan Carusone, University of Toronto
